

POINTS TO NOTE IN ORTHOGRAPHIC PROJECTION

- i. Enough space should be left between the views on a drawing to accommodate dimension and notes without crowding.
- ii. The drawing should be planned before beginning.
- iii. Hidden detail should only be used where it is essential for a complete description of the object but it should not be used for dimensioning.
- iv. Avoid completing the view separately since it wastes time. Measurements can often be made on two or more views simultaneously or projected from one to another as soon as they are made therefore build all the views together.
